Introduction

- William Cox
 - Principal, Cox Software Architects LLC
 - Consulting Software Architect
 - Specializing in Smart Grid architecture and information definitions
- Toby Considine
 - Principal, TC9, Inc (www.tcnine.com)
 - Strategic Technology Consulting
 - Enterprise integration of Smart Buildings and Smart Energy

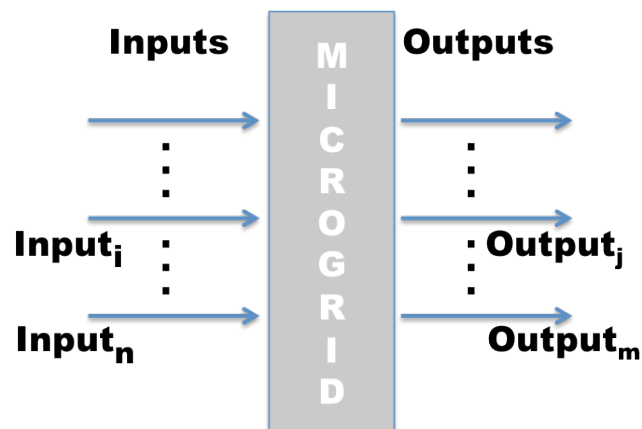

What Are Energy Ecologies?

- Ecology from Greek:
 - οἶκος, "house"; -λογία, "study of"
- Economics from Greek:
 - οἰκονομία (oikonomia, "management of a household, administration")
- Energy Ecologies: The study of the economic interchange, conversion, and management of energies within a facility or microgrid

The View From a Node

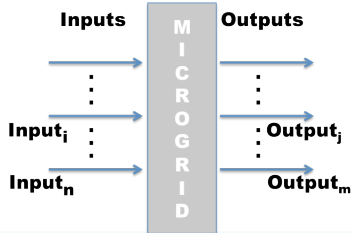

- 0..n Energy Inputs, 0..m Energy Outputs

Grid-Interop
Driving to Grid 2020

At the Node

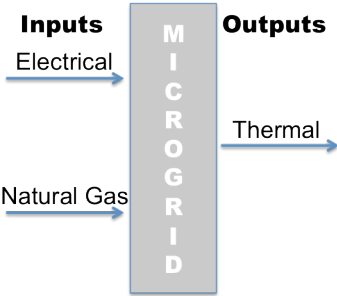

- Each available input
 - Has a price and product definition (including time)
 - May have EMIX source warrants
- Each possible output
 - Has a price and product definition (including time)
 - May have EMIX source warrants

Grid-Interop
Driving to Grid 2020

Example: Dual Fuel Boiler

- A dual-fuel boiler can use multiple sources
 - For example Natural Gas and Electricity
- Cost of input may be mitigated by cost of output
 - E.g. Steffes paper, Grid-Interop 2011

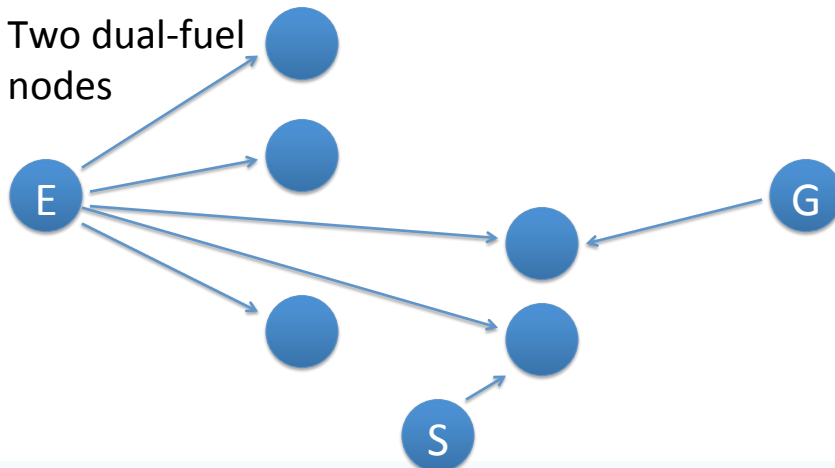

Example: Storage

- Storage can take many forms
 - Time-delayed output, bounded storage
 - Energy embodied in finished product
 - E.g. aluminum embodies large energy costs of production
 - Energy embodied in intermediate product
 - E.g. forged blanks for further machining
- Involves delayed flows
 - Petrie nets or similar techniques may be more intuitive

The View “Outside the Paper”

- A graph where the vertices are nodes and the edges are potential transformation links
- Two dual-fuel nodes

Grid-Interop
Driving to Grid 2020

Feasible Transformations

- Without extraordinary measures, only some conversions are feasible
- Ignore like-to-like

| Input | | | | |
|-------------|-------------|------------|---------|---------------|
| Natural Gas | | | | |
| Electrical | | | | |
| Thermal | | | | |
| | Natural Gas | Electrical | Thermal | Output |

Grid-Interop
Driving to Grid 2020

Conversion Efficiency

- Sample conversion efficiencies
- Not necessarily for real devices

| Input | | | | |
|-------------|-------------|------------|---------|---------------|
| Natural Gas | | 0.65 | 0.99 | |
| Electrical | | | 0.99 | |
| Thermal | | 0.50 | | |
| | Natural Gas | Electrical | Thermal | Output |

Driving to Grid 2020

Input Cost

- Input costs in cents/MJ (cents per megaJoule)
- Prices for natural gas and electricity are NJ prices November 2012
- Price for thermal is a guess
 - Used the value of the natural gas assuming high efficiency of transformation

| Input Cost C/MJ | |
|-----------------|-----|
| Natural Gas | 0.5 |
| Electrical | 3.2 |
| Thermal | 0.5 |

Driving to Grid 2020

Output Cost

- Multiplying (Input Cost / Efficiency)
- Costs are cents/MJ

| Input | | | | |
|-------------|-------------|------------|---------|--------|
| Natural Gas | | 0.79 | 0.52 | |
| Electrical | | | 3.25 | |
| Thermal | | 1.02 | | |
| | Natural Gas | Electrical | Thermal | Output |

Discovering Sources

- Find feasible transform source among inputs
- If none, use graph search algorithms
- May pre-compute

```

graph LR
    E((E)) --> N1(( ))
    E --> N2(( ))
    E --> N3(( ))
    E --> N4(( ))
    G((G)) --> N5(( ))
    S((S)) --> N6(( ))
  
```

Grid-Interop
Driving to Grid 2020

Complexity and Other Issues

- The graph of nodes, input and output links is sparse
- Input costs are less simple than shown
- Input costs, hence output costs
 - Are time-varying
 - May have thresholds where costs change
- Imputing of capital and (internal) distribution costs is difficult
- Flow rates will vary
- Constraints on flows and storage require models

Driving to Grid 2020

Benefits

- Robust and resilient systems can discover alternate sources for specific inputs
- Common framework for cost
 - Using matrix algebra
 - Many input costs are consistent across a facility
- Simple conceptual model for use of diverse energy sources
- Simple conceptual model for outputs
